

How to re-align bowing sliding doors

We always suggest getting Flexi Robes to adjust doors that are bowed but this simple guide shows you how easy it is.

Adjustment Nuts

All Flexi Robes sliding Panel doors have tensioning rods installed on the back of the doors. Some have two and some as many as four rods.

- At the the bottom of the rods are brackets that enclose a nut. Adjusting this nut is the answer to how to straighten a bowed door.
- Using a 10mm open ended spanner Simply turn each of the nuts 6 turns in the same direction.
- Check the doors alignment to see if it appears better or worse as doors can bow out or inwards. If the door appears to be straightening continue turning the nut until the door is straight (no bowing).

If the bowing is increasing turn the nuts in the opposite direction until doors straighten up.

Remember to tighten each nut on each rod the same amount of turns, no more than 6 at a time.
